Title: **Study of Digital to Analog Conversion (QAM) using Simulink** **Abstract:**

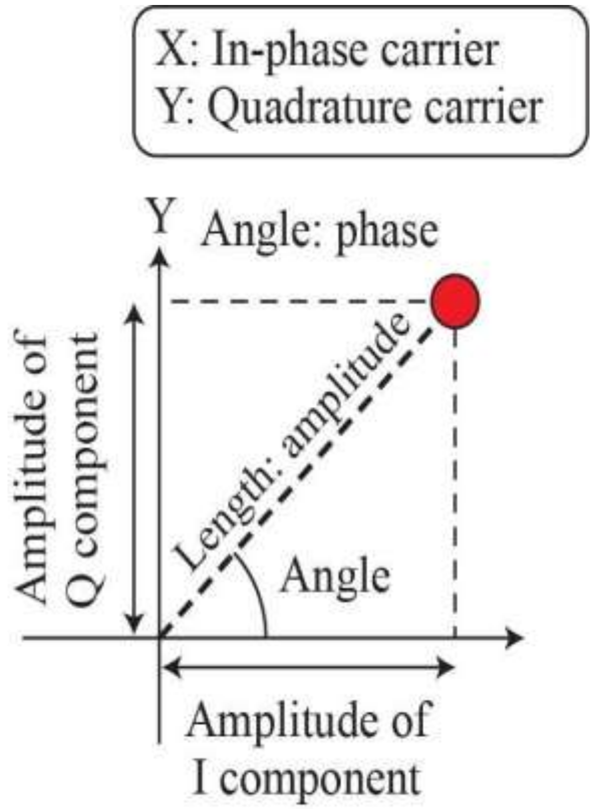
This experiment is designed to-

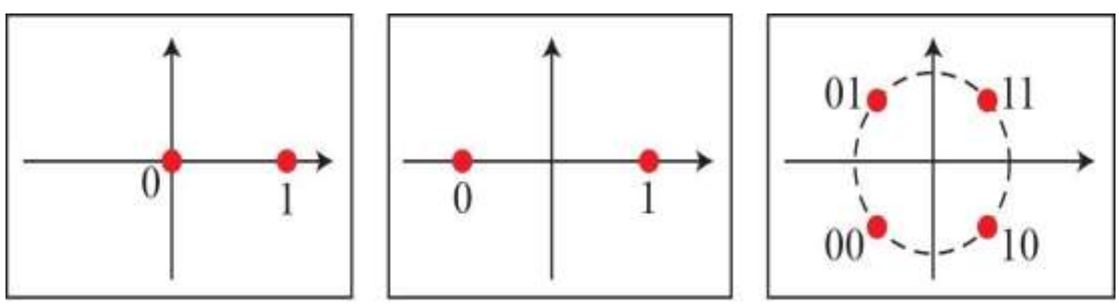
1.To understand the use of MATLAB for solving communication engineering problems.
2.To develop understanding of QAM, Constellation diagram and Finding Bit Error rate

Introduction:

PSK is limited by the ability of the equipment to distinguish small differences in phase. This factor limits its potential bit rate. The idea of using two carriers, one in-phase and the other quadrature, with different amplitude levels for each carrier is the concept behind **quadrature amplitude modulation (QAM).**

Quadrature amplitude modulation is





a. BASK (OOK) b. BPSK c. QPSK

a

combination of ASK and PSK.

Figure 1: ***Concept of a constellation diagram***

The possible variations of QAM are numerous. Figure shows some of these schemes. Figure (a) shows the simplest 4-QAM scheme (four different signal element types) using a unipolar NRZ signal to modulate each carrier. This is the same mechanism we used for ASK (OOK). Part b shows another 4-QAM using polar NRZ, but this is exactly the same as QPSK. Part c shows another QAM-4 in which we used a signal with two positive levels to modulate each of the two carriers. Finally, Figure (d) shows a 16-QAM constellation of a signal with eight levels, four positive and four negative.

The minimum bandwidth required for QAM transmission is the same as that required for ASK and PSK transmission. QAM has the same advantages as PSK over ASK.

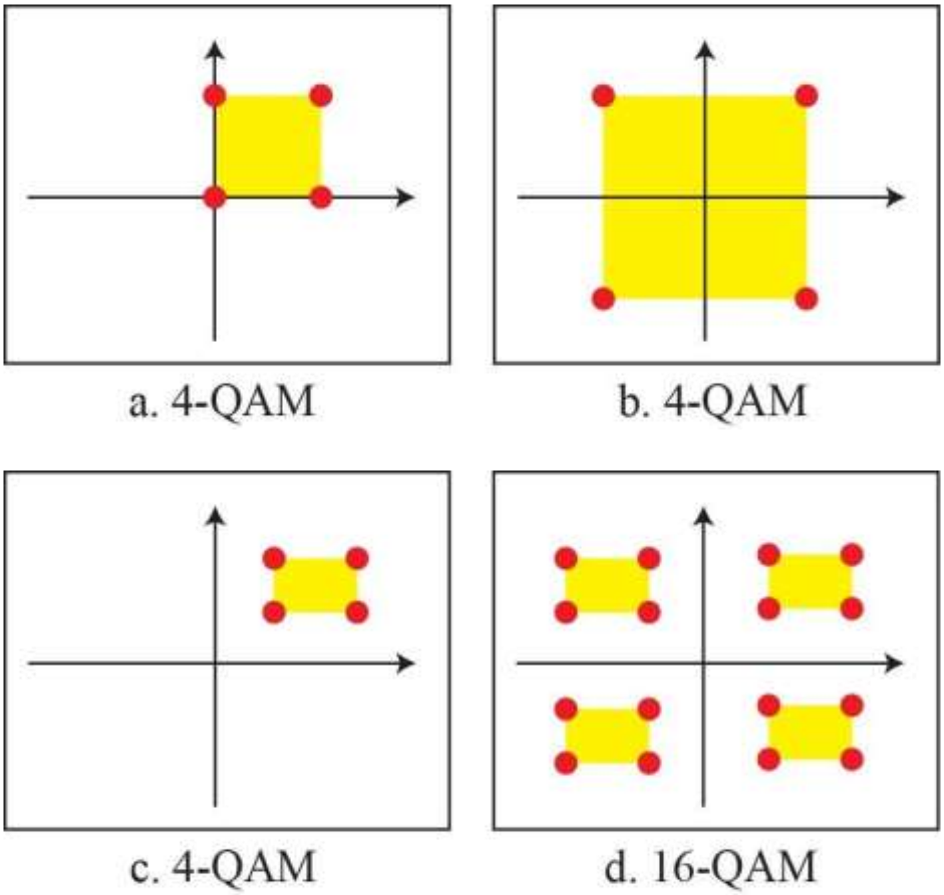


Figure 2: Constellation Diagram of QAM

The demodulator maps the received signal (possibly distorted due to noise in the channel) back to bit streams.

For 16 QAM, the Bit Error Rate (BER) is the same as BPSK.

$$\text{BER} = \frac{3}{4}\, Q\left(\sqrt{\frac{4E_b}{5N_o}}\right) \qquad \text{Psc} = \frac{6}{4}\, Q\left(\sqrt{\frac{E_s}{5N_o}}\right)$$

Since in QAM modulation two carriers are used, the Symbol Error Rate per carrier is given by:

And the total Symbol Error Rate is given by:

$$Ps = 1 - (1 - PsC)^2$$

Where $N_0/2$ is the noise power spectral density, and Q(.) is the Q function of the Gaussian distribution.

Simulink Model:

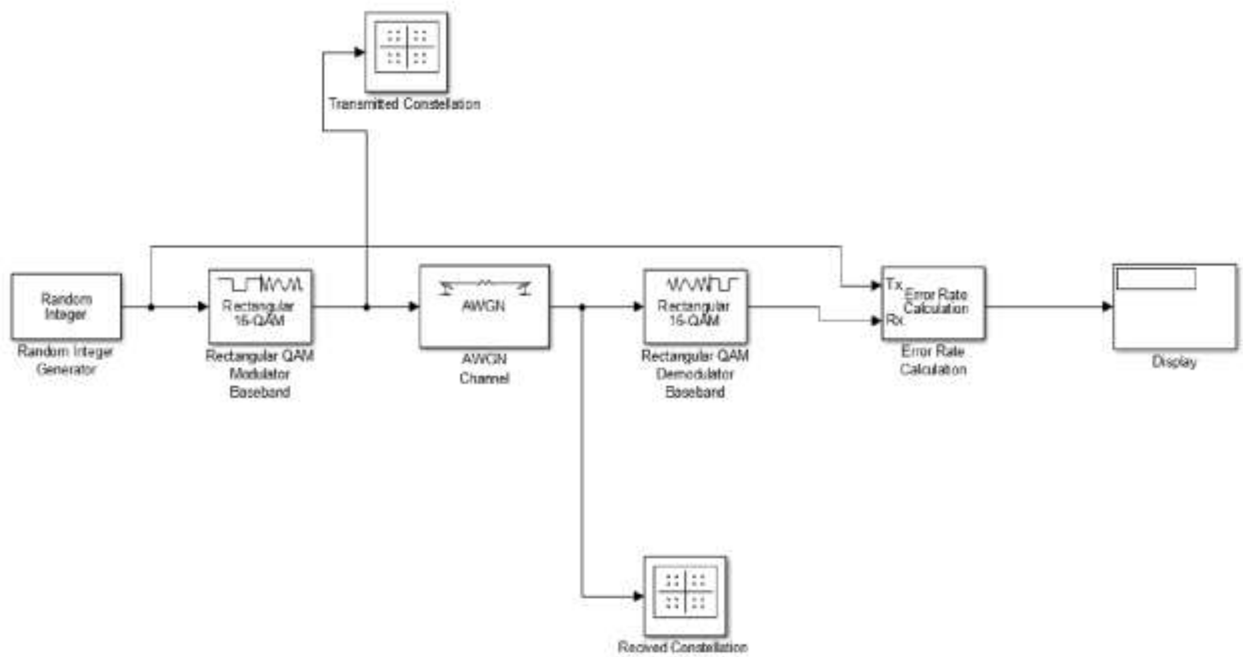

Figure: 16-QAM Simulation Model

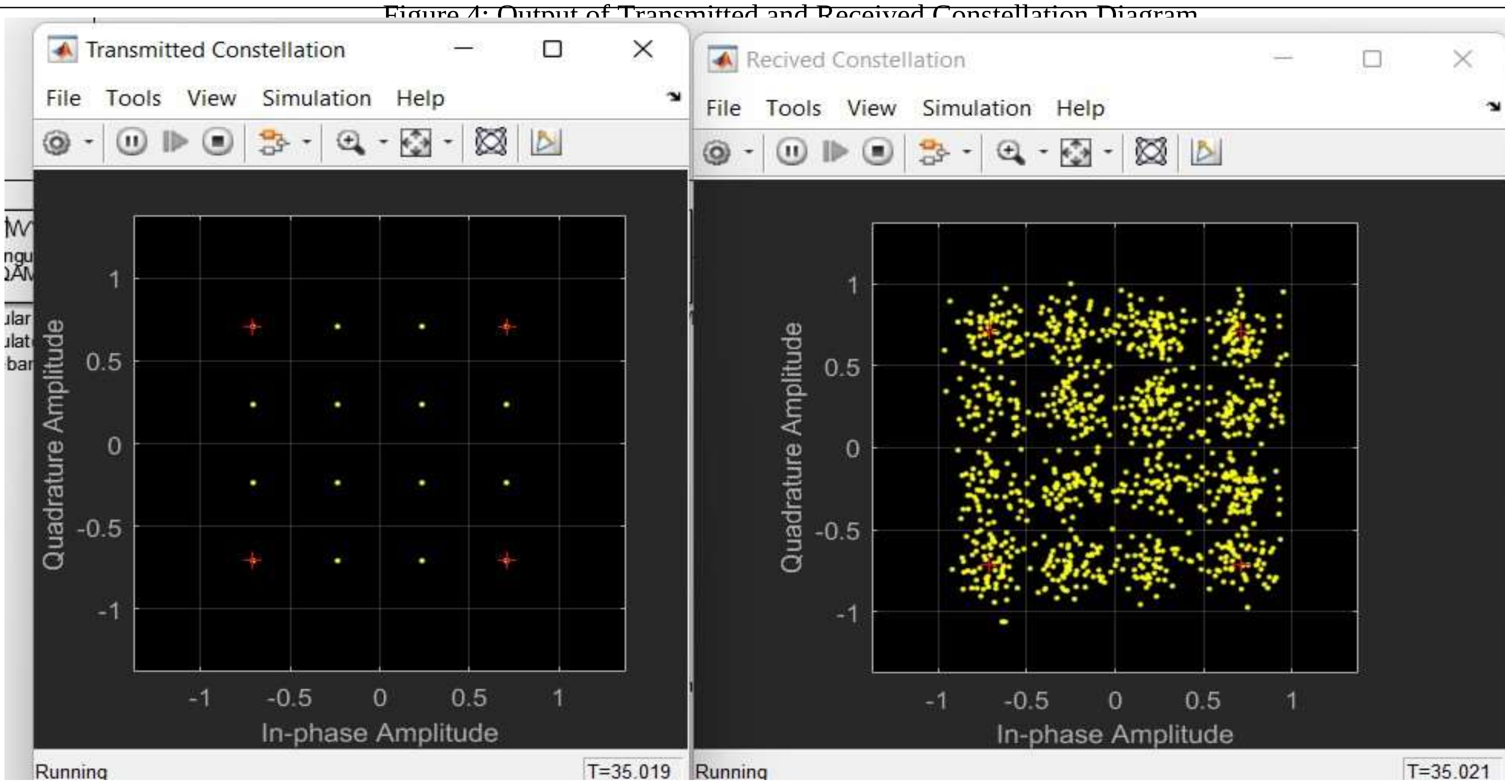
Figure 4: Output of Transmitted and Received Constellation Diagram



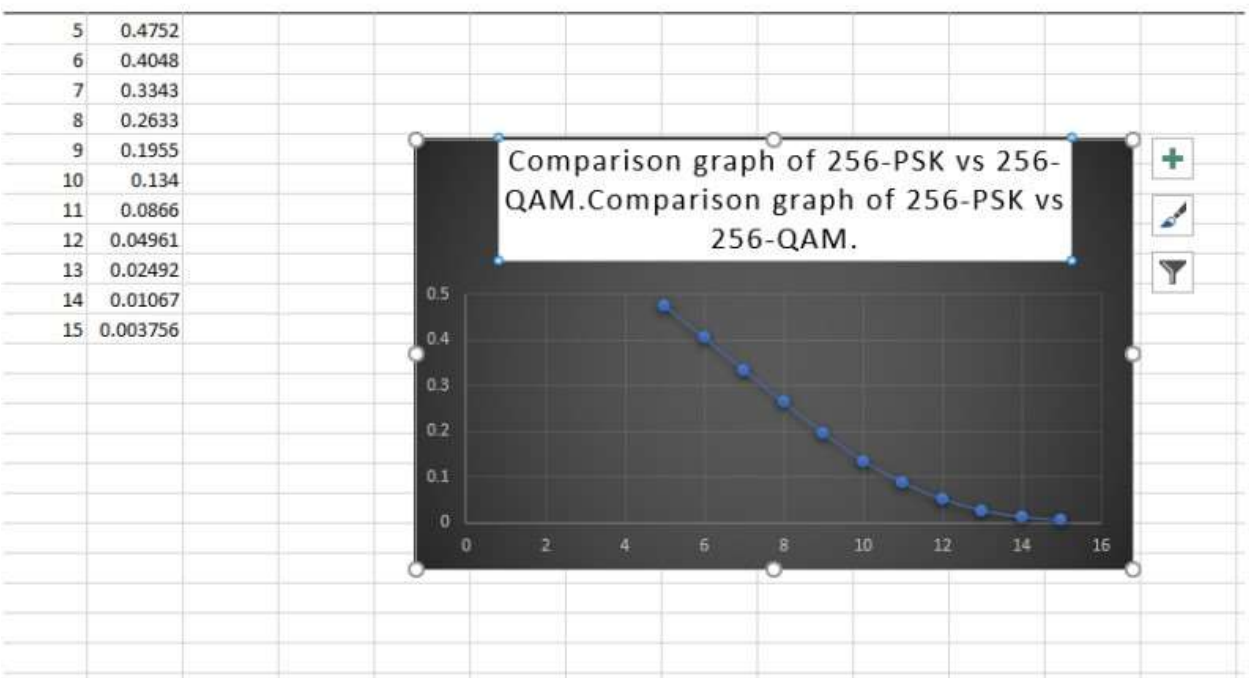


Figure 5: Bit Error rate QAM

The Display Block will show you three values. The first value is the BER, the second value is the number of incorrect bits, and the third value is the total number of bits received.
